Agenda

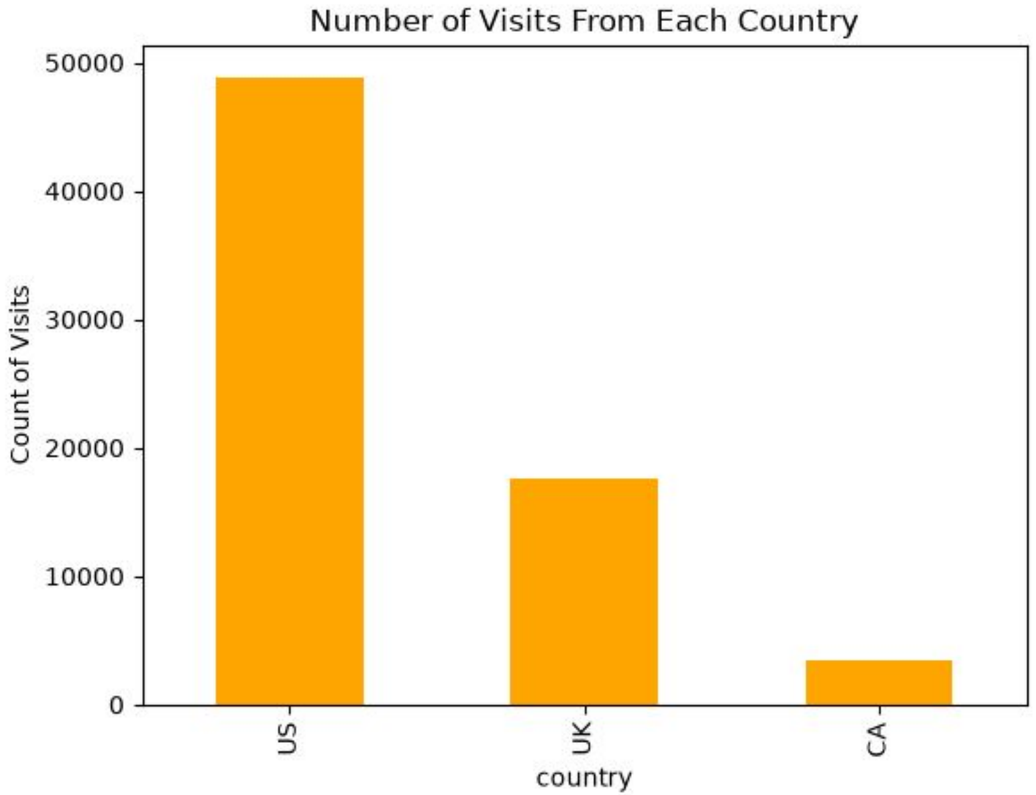

Findings of A/B test analysis

- Experiment Setup
- Conversion Rates
- Experiment Results

How Was the Experiment Implemented?

Total Variant Visitors: **35211**

Total Control Participants: **34678**

Conversion Rates

	U.S.	U.K.	CA
Control	**10.7%**	**10.2%**	**9.4%**
Treatment	**15.8%**	**14.9%**	**15.4%**

Executive Summary: The treatment rate is higher than the control rate by about 5.1 percentage points in the US, 4.7 in the UK, and 6.0 in Canada. The effect of the new page appears to be consistent. So it does not appear that there is an interaction between country and treatment in terms of conversion.

Experiment Results

- Treatment Conversion Rate: **15.53 %**
- Control Conversion Rate: **10.53 %**
- Delta in Treatment vs. Control Conversion Rate: **5.01 percentage points**
- p-value: **0.0000**
- Conclusion:
  - The p-value is 0, which is lower than the Type I error rate of 0.05, so we reject the null hypothesis.
  - There is evidence that the new page has a higher conversion rate than the old page.
